GLASSWORKS AXUM BOHEMIA – BRIEF INFORMATION

TECHNOLOGY

Glassworks Axum Bohemia is specialized on processing of float glass by fusing technology. Glass fusing is the process of using a kiln to join together pieces of glass and to bend and shape pieces of glass using the heat of a kiln.

This technology provides significant flexibility in designing of different shapes of plates, serving trays and dishes and helps to manufacture glass products in shapes, which can't be produced by standard glassmaker's technologies.

The fusing technology brings a lot of advantages in compare to usual technologies of glass and porcelain production:

Original colour design and shaping of products: The method enables one to produce such shapes and colour combinations unobtainable with other technologies of glass processing and decoration (sandblasting, etching, painting, adhesive bonding, engraving, cutting, etc.).

The glass is compatible with microwave ovens, grill or salamander (up to 120°C, please, look the technical specifications)

All colour executions are dishwasher safe. Even after long-time using is the colour absolutely stable. It is due to the fact that we do not use any sprayed colour but coloured glass powder, which is melted into surface of glass product under temperature of 800 degrees of Celsius.

Possibility to produce specially designed products in small quantities (e.g. customers exclusive collections). Nowadays Axum Bohemia produces on 11 kilns - it is a necessary production base for cooperation with huge worldwide distributors, but on the other hand the fuse technology allows delivering specially designed products in small quantities too.

Health safety: From the point of view of safety, glass is a completely harmless material. Safety certificates as regards cadmium and lead content in glass cover the products. Only tested compatible materials are used for the manufacture of fused glass.

Durable appearance: The material - glass - is an inert substance and therefore all types of products intended for use in gastronomic services as well as utility and decorative glass objects are fully resistant to wear in automatic dishwashers, and are compatible with microwave ovens. Accurately specified principles and heat-up and cool-down curves of glass are observed to prevent the glass from becoming brittle, i.e. permanent internal stress resulting in uncontrollable shattering.

Cheaper and easier production and development of new moulds and cooperation with skilled designers enables high level of modern design. Different thickness of glass material (from 4mm up to 12mm) is used to optimize quality and resistance of glass plates

PRICE LEVEL

It is difficult to compare prices with other fused glass producers because Axum Bohemia produces mainly original products (original design, size, thickness, colour execution).

Price level of Axum Bohemia products can not compete with prices of glass or porcelain products which are produced in huge quantities on automatic machines (not fused). But advantage of Axum Bohemia product is not in low price and huge quantity

REFERENCES

About 97% of our production is exported to more than 40 countries all over the world. Among our references is a long-term cooperation with companies such as Villeroy&Boch, Dudson (UK), Zwiesel Kristallglas and main international hotel chains (Hilton, Marriott, Intercontinental, Four Seasons, etc.)

TECHNICAL SPECIFICATIONS

Tension

Residual tension value determines the stress level into the glass. It directly affects the durability of the glass products and its resistance to thermal shocks. This value is measured with approved spectrometers. Our products are delivered with residual tension value lower than 250 nm/cm.

Lead and Cadmium

We are using exclusively non-toxic colours for our products. They are lead and cadmium free. It means no lead and no cadmium are leaching into the food after heating.

Colour resistance

The colours are burnt into the glass and therefore absolutely dishwasher resistant. They do not flake during dishwashing. The colours are acid resistant as well and do not fade or blur under 6% citric acid attack.

Scratches resistance

Our glass withstands scratches of HRB 62 on the Rookwell hardness scale or of 8 on the Mohs scale from steel cutlery (Cr/Ni plated).

Heat resistance

The glass can be heated in grill or salamander up to 120°C. Direct contact with the heating elements can cause breaking the glass. Thermal shocks can break the glass as well.

Microwave resistance

Our products are microwave resistant.
